Coding 8 — Latihan Enemy, Goblin, dan Dragon

Polimorfisme dalam Pemrograman Gim (C#) • File kode: MainClass.cs

```
using System;

namespace GamePolymorphism
{
    public class Enemy
    {
        public string name;
        public int hp;
        public int damage;

        public virtual void Attack()
        {
            Console.WriteLine("Enemy attacks!");
        }
    }

    public class Goblin : Enemy
    {
        public int bonusSpeed;

        public override void Attack()
        {
            Console.WriteLine("Goblin stabs with dagger! Deals " + damage);
        }
    }

    public class Dragon : Enemy
    {
        public int fireDamage;

        public override void Attack()
        {
            Console.WriteLine("Dragon breathes fire! Deals " + fireDamage);
        }
    }

    public class MainClass
    {
        public static void Main(string[] args)
        {
            Enemy[] enemies = new Enemy[4];

            enemies[0] = new Goblin
            {
                name = "Goblin Scout", hp = 80, damage = 20, bonusSpeed = 10
            };
            enemies[1] = new Dragon
            {
                name = "Dragon", hp = 500, damage = 100, fireDamage = 120
            };
            enemies[2] = new Goblin
            {
                name = "Goblin Warrior", hp = 100, damage = 25, bonusSpeed = 5
            };
            enemies[3] = new Dragon
            {
                name = "Young Dragon", hp = 300, damage = 70, fireDamage = 90
            };

            foreach (Enemy enemy in enemies)
            {
                enemy.Attack();
                ShowBossInfo(enemy);
            }
        }
```

```
        public static void ShowBossInfo(Enemy e)
        {
            if (e is Dragon)
            {
                Dragon dragon = (Dragon)e;
                Console.WriteLine("Boss: " + dragon.name);
                Console.WriteLine("Fire Damage = " + dragon.fireDamage);
            }
        }
    }
}
```
